storj flowchart on telehash v3
(abstraction layer,uploader and farmer implementation)

memo:
- router may do hard work when broadcasted because all mesh links router. maybe router should be disconnected after offering ip:port of other mesh link. but it means all meshes are not anonymous.
- 'door-to-door sales' may be needed, where service providers ask uploaders to use their serviee.
- libswift needs raw ip:port, which means nodes are not anonymous in the party.
- reputation is not considered for now. only farmer and uploader are considered.
